

DRAINAGE IMPROVEMENTS

Brandon, MS

Estimated Cost: \$400,000

Federal/State Funds: \$400,000 (NRCS)

Over the years, Guest Consultants has been asked to work on multiple drainage projects. Some of these projects have ranged in scope from emergency repairs due to possibly a storm drain collapse to large scale drainage projects including re-channelization and/or relining. One project that we have worked on included the relining and channelizing of three ditches in the City of Brandon. Of these three ditches, two of the ditches received riprap and grouted riprap, while the other received the more aesthetic concrete filled Fabriform. These ditches were becoming a maintenance problem to the City, and were causing some minor backing up of water into unwanted areas. Since the work was performed on these ditches, which Guest Consultants designed and oversaw, the City has not had the flooding and maintenance issues it once had.
